## 1 PROBLEM

gov/stats/2018/STATISTICS-PAPER-2 , Q.58

Let  $X_1$  and  $X_2$  be i.i.d random variables with poisson. Then  $(X_1 + 2X_2)$  is not sufficient because

- 1)  $\Pr(X_1 = 1, X_2 = 1|T = 3)$  depends on  $\lambda$
- 2)  $X_1 + 2X_2$  is poisson
- 3)  $X_1 + 2X_2$  is not poisson
- 4)  $\Pr(X_1 = 1, X_2 = 1|T = 3)$  is Poisson with parameter one

Where  $T = (X_1 + 2X_2)$

## 2 SOLUTION

**Definition 1.** *Statistic* : A statistic is a function  $T = r(X_1, X_2, \dots, X_n)$  of the random sample  $X_1, X_2, \dots, X_n$ .

**Definition 2.** *Sufficient Statistics* : A statistic  $t = T(X)$  is sufficient for  $\theta$  if the conditional probability distribution of data  $X$ , given the statistic  $t = T(X)$ , doesn't depend on the parameter  $\theta$ .

**Theorem 2.1** (Factorization theorem). : Let  $X_1, X_2, X_n$  form a random sample from either a continuous distribution or a discrete distribution for which the pdf or the point mass function is  $f(x|\theta)$ , where the value of  $\theta$  is unknown and belongs to a given parameter space  $\Theta$ . A statistic  $T(X_1, X_2, X_n)$  is a sufficient statistic for  $\theta$  if and only if the joint pdf or the joint point mass function  $f_n(x|\theta)$   $X_1, X_2, X_n$  can be factorized as follows for all values of  $x = (X_1, X_2, X_n) \rightarrow R^n$  and all values of  $\theta \in \Theta$ :  $f_n(x|\theta) = u(x)v[T(x), \theta]$ .

Here the function  $u$  may depend on  $x$  but does not depend on  $\theta$ , and the function  $v$  depends on  $\theta$  but

will depend on the observed value  $x$  only through the value of the statistic  $T(x)$ .

We know  $T=3$  when  $(X_1, X_2)$  have values  $(1,1)$  and  $(3,0)$

$$\Pr(X_1 = 1, X_2 = 1|T = 3) = \frac{\Pr(X_1 = 1, X_2 = 1 \cap T = 3)}{\Pr(T = 3)} \quad (2.0.1)$$

$$= \frac{\Pr(X_1 = 1, X_2 = 1)}{\Pr(X_1 = 1, X_2 = 1) + \Pr(X_1 = 3, X_2 = 0)} \quad (2.0.2)$$

$$= \frac{e^{-2\lambda}\lambda^2}{e^{-2\lambda}\lambda^2 + \frac{e^{-3\lambda}\lambda^3}{6}} \quad (2.0.3)$$

$$= \frac{6}{6 + \lambda} \quad (2.0.4)$$

$\Rightarrow$  option 4 is incorrect and option 1 is correct.  
Now to find pdf of  $T$ ,

$$\Pr(T = x) = \Pr(X_1 + 2X_2 = x) \quad (2.0.5)$$

$$= \sum_{i=0}^{\infty} \Pr(X_1 = x - 2i) \Pr(X_2 = i) \quad (2.0.6)$$

$$= \sum_{i=0}^{\infty} i = 0^{\infty} \frac{e^{-\lambda}\lambda^{x-2i} \times e^{-\lambda}\lambda^i}{(x-2i)!i!} \quad (2.0.7)$$

$$= e^{-2\lambda}\lambda^x \sum_{i=0}^{\infty} \frac{\lambda^{-i}}{(x-2i)!i!} \quad (2.0.8)$$

We find that the above expression is not reducible to the form of  $\frac{e^{-\mu}\mu^x}{x!}$

Hence  $X_1 + 2X_2$  is not poisson distribution.

$\Rightarrow$  option 2 is incorrect, option 3 is correct

Hence options 1 and 3 are correct.
